

The dataset contains word frequencies based on movie and tv show subtitles for 517564 Italian word forms. For each form, it also includes information about its lemma/s, part of speech and relative frequencies.

wordform: the actual form

freq_count: the raw frequency (i.e., the total number of times a wordform appears in the whole corpus)

zipf: frequency, zipf-transformed following Van Heuven et al. (2014)

cd_count: contextual diversity, following Adelman et al. (2006) (i.e., the number of different movies that a wordform appears in)

dom_pos: part-of-speech of the dominant lemma

dom_lemma: dominant lemma

dom_lemma_frequency: frequency of the dominant lemma

all_pos: all parts-of-speech. This applies to those wordforms that come from different lemmas, with different POS

all_lemma: list of lemma associated with different POS for the same wordform

all_pos_frequency: it's the wordform frequency separately reported with respect to each separate POS

all_pos_lemma: lists all lemma with their corresponding part of speech associated with the same wordform

all_pos_lemma_freq: it's the lemma frequency separately reported with respect to each separate POS

NB: The SUBTLEX-IT corpus was automatically parsed and lemmatized with TreeTagger (Schmid, 1995,1994). Lemmatization was outside of the main scope of the project, so we didn't make a strong effort to make it bullet-proof – apologies. Our estimates are that ~95% of lemmas/POS will be correct; this should be sufficient for most purposes. However, if you notice an error, please do not hesitate to get in touch with us (simona.amenta@unimib.it, davide.crepaldi@sissa.it) – or suggest better/newer lemmatizers. We are continuously working to improve our database and any feedback is welcome.
